

ABSTRACT

The invention concerns a perforated skin consisting of at least one layer (N1-N3) of substantially rectilinear fibers associated with a resin and whereof the perforations define a regular repeated pattern (a, b, c), characterized in that the perforations affect at least 25 % of the skin and in that, at least in a major part of the perforated skin, fibers (C1-C3) of said layer(s) (N1-N3) are uninterrupted by the perforations (P1-P3).
